

Environmental Policy (ISO 14001)

We use the environmental management system as specified by the standard ČSN EN ISO 14001. The aim is to protect the environment not only within the organization and its surroundings but also at our clients' premises. We have therefore adopted the following environmental policy:

Not only product quality but also protecting our environment

We fulfil this elementary motto by concentrating on the following fundamentals:

1) Responsible attitude towards our environment

- We introduce only technologies which have minimum impact on the environment. We assess the impact of new technologies before taking a decision on their implementation.
- We only introduce products to the market or for further processing for which environmentally sound utilization is resolved at every stage - while in storage, in use or at disposal.
- We continuously seek opportunities for reducing energy consumption and incoming materials. We manage dangerous substances and sort different types of waste.
- By consistently preventing risks and pollution we prevent the possibility of extraordinary events arising, the consequences whereof could have a negative impact on the environment.

2) Communication on matters concerning the environment

- We communicate our environmental policy to all employees and using suitable means we all so pass it onto other concerned parties. We manage and educate our employees to have a responsible attitude towards the environment with the aim to achieve their full understanding, support and enforcement of this environmental policy.
- We require our contractual partners to fully respect our environmental policy. We expect this of our suppliers and within the scope thereof we require that they abide by the same or similar rules.
